MEDICAL ORDER
ID: #63047 | 09/05/2026

PATIENT NAME MERU MITHA .	MRN / ID 0013196	AGE / GENDER 62 / Female	ORDERED DATE 09/05/2026
REQUESTED BY Dr. Michael Yirgalem Teka	REQUESTED FROM Emergency Phase 2	COLLECTION DATE 09/05/2026	PATIENT PHONE +251901924424
COLLECTED BY Dr. Alemayehu Bedane Worke	PROCESSED BY Dr. Alemayehu Bedane Worke	VERIFIED BY Dr. Alemayehu Bedane Worke	AUTHORIZED BY Dr. Alemayehu Bedane Worke
AUTHORIZED DATE 09/05/2026			

IMAGING**MRI****# PARAMETER**

1 MRI of Cervical Spine

CLINICAL EVALUATION & FINDINGS

Indication: Lower back pain radiating to bilateral lower extremity and Cervical pain radiating to the left hand associated with left hand weakness. (3 years duration) Reading by Dr Alex

Mitah Meru

INDICATION:

TECHNIQUE:-

Multiplanar, multisequence MR images of the cervical spine were acquired without intravenous contrast

FINDINGS:

- Alignment: straightened outline.
- Vertebral body height and marrow signal: unremarkable
- T2 disc signals and heights : decreased disc signal at all levels suggesting their dehydration.
- Pre- and Paraspinal soft tissue : unremarkable
- Craniocervical junction: unremarkable
- Posterior fossa: unremarkable
- Pre- and para vertebral soft tissues have normal signal intensity.
- C2-3 level is normal.
- C3-4 level is normal.
- C4-5 and C5-6 level : diffuse disc bulge causing mild anterior thecal sac indentation. Normal neural foramina
- C6-7 level : left uncus hypertrophy, broad-based posterior disc protrusion causing moderate spinal canal narrowing and left mild neural foraminal stenosis. mild focal anterior cord indentation without signal change noted at this level

IMPRESSION:

- C4-5 and C5-6 level : diffuse disc bulge causing mild anterior thecal sac indentation. Normal neural foramina
- C6-7 level : left uncus hypertrophy, broad-based posterior disc protrusion causing moderate spinal canal narrowing and left mild neural foraminal stenosis. mild focal anterior cord indentation without signal change noted at this level
